Research Scholar, Ph. D. in Education, Dr. A.P.J. Abdul Kalam University, Indore M.P., India

ABSTRACT

When a student has environmental knowledge, it is described as the collection of facts concerning environmental concerns that the student has. Ecological ideas, pollution, nature, wildlife, resources, population, and individuals and organisations all play a role in the environmental movement's findings, facts, and figures. As a result of this research and conversation, environmental knowledge has been examined. It is true that man's ignorance of nature is to blame for most of the harm done to the world. For a long time, discussions in the social sciences on science, technology, and humanity were centred on how best to put such tools to use for human benefit while also maximising the extraction and use of natural resources. Today, the primary topic of debate is how to effectively use science and technology without jeopardizing the world and how to best protect the remaining resources for our children and grandkids.

Keywords: Environmental Knowledge, Environmental Attitudes
